General Description

The HMC306MS10 is a broadband 5-bit positive control GaAs IC digital attenuator in a 10 lead MSOP surface mount plastic package. Covering 0.7 to 3.8 GHz, the insertion loss is typically less than 1.5 to 2.3 dB. The attenuator bit values are 0.5 (LSB), 1, 2, 4 and 8 dB for a total attenuation of 15.5 dB. Attenuation accuracy is excellent at ± 0.25 dB typical with an IIP3 of up to +52 dBm. Five bit control voltage inputs, toggled between 0 and +3 to +5V, are used to select each attenuation state at less than 50 uA each. A single Vdd bias of +3 to +5V applied through an external 5K Ohm resistor is required. The HMC306MS10 occupies less than 14.8 mm².

Electrical Specifications,

$T_A = +25^\circ\text{C}$, $V_{dd} = +3\text{V to } +5\text{V}$ & $V_{CTL} = 0/V_{dd}$ (Unless Otherwise Stated)

Any combination of the above states will provide an attenuation approximately equal to the sum of the bits selected.

Control & Bias Voltages

State	Bias Condition
Low	0 to +0.2V @ 20 μ A Max.
High	Vdd \pm 0.2V @ 20 μ A Max.

Note: Vdd = +3V to 5V \pm 0.2V

Application Circuit

Note:

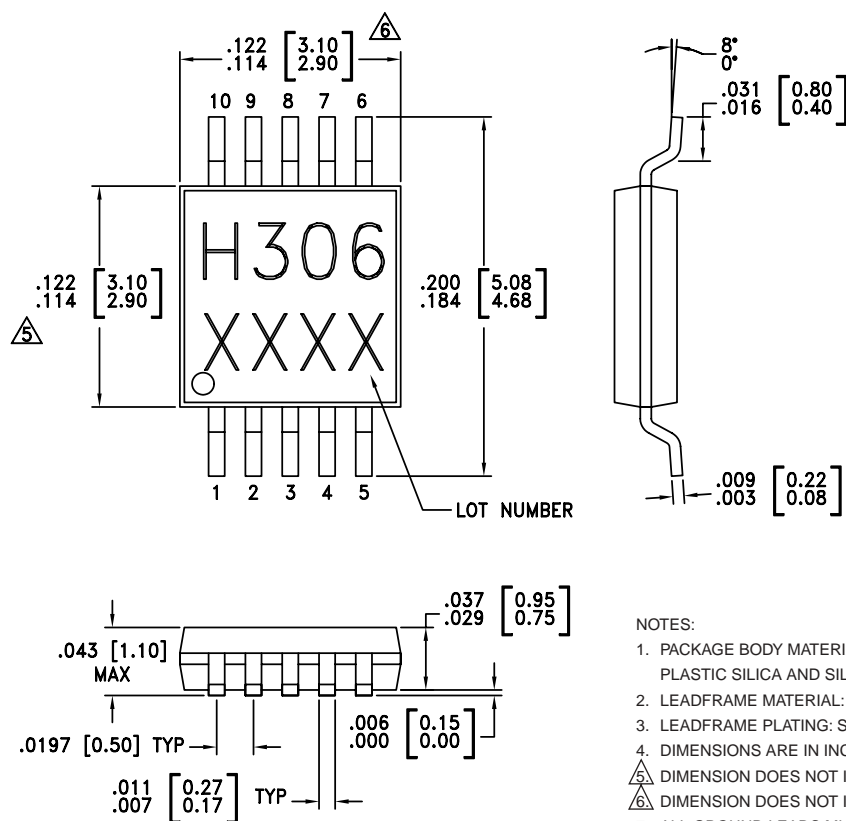

DC Blocking Capacitors C1 & C2 are required on RF1 & RF2. Choose C1 = C2 = 100 ~ 300 pF to allow lowest customer specific frequency to pass with minimal loss. R1= 5K Ohm is required to supply voltage to the circuit through either Pin 6 or Pin 10.

Evaluation Circuit Board

The circuit board used in the final application should use RF circuit design techniques. Signal lines should have 50 ohm impedance while the package ground leads should be connected directly to the ground plane similar to that shown. A sufficient number of via holes should be used to connect the top and bottom ground planes. The evaluation circuit board shown is available from Hittite upon request.
